

Pacesetter

Pro Series

Pro Series is Precision.

When precision printing matters, look to The Pro Series. We at Pacesetter know that different applications require special compounds. The Pro Series compound is designed to transfer ink efficiently to the plate for precision printing.

Pacesetter knows the importance of providing different durometers to accommodate the function of a roller. We provide position specific compounds to meet or exceed OEM specifications and recommendations from GATF.

Pacesetter puts as much consideration into our cores as we do our Award winning compounds. We provide you with a brand new core matching appropriate wall thicknesses, hardness and weights that can withstand the higher demands at the faster speeds of today's presses.

By pairing the Pro Series compound with the ability to provide position specific durometers all on a brand new guaranteed true to center core, Pacesetter supplies you long lasting precision rollers that are "Ready to Run!"

Pro Series

INK DUCTOR

The most abused roller in the press. The mechanical stress requires a special compound and durometer.

INK FORM

Gap deflection is the issue. Compound with proper durometer will deliver a consistent flow of ink and water to the plate resulting in sharp dot quality and dense solids.

DISTRIBUTOR/RIDER

The distributor roller is basically an ink mill blending ink and water while a vibrator is oscillating across it. This will require a compound with high resilience as well as durometer. Maintaining proper settings is important to ink and water balance.

24/7 WATER METER

The 24/7 meter compound was designed to stay in the press 24/7. The 24/7 water meter increases water pick-up, while providing unbelievable balance, ensuring great start ups.

WATER FORM

Like the ink form, it too must run free of gap deflection and also be compatible with the fountain solutions. Proper setting will deliver peak performance.
